The Measuring of the Electric Current in the Sea.  
(Izmereniye elektricheskogo toka vokeane -Russian)

**PERIODICAL**

Doklady Akademii Nauk SSSR, 1957, Vol 113, Nr 4, pp 787-790 (U.S.S.R.)  
Received 6/1957 Reviewed 7/1957

**ABSTRACT**

During the first antarctic expedition undertaken (1955-1956) on the ship "OB" a group of members of the Oceanographical Institute of the Academy of Science of the USSR carried out measurements of electric current in the Indian Ocean. In the sea the strength of telluric currents is much greater than on land. The deviation of the magnetic from the geographical poles is probably due to the distribution of the currents in the oceans. The current density measured in the surface layers of the sea is quite insufficient for the quantitative explanation of the phenomena. Therefore the aforementioned Institute carried out investigations (which, for the time being were only informative) of the density distribution of telluric currents in various depths and in various areas of the oceans. Considerable interest was aroused by the examination of the electric field in the areas with the greatest latitudinal component of the electromagnetic field and within range of the magnetic equator. Measurements were started from the ice cover in the Davis Sea on the antarctic coasts at horizons (depths ?) of 0,100 and 200 m. The second measurement was carried out in the Indian Ocean in depths of up to 500 m. Within the region of the magnetic equator the gradient of the potentials of the electric amperage was measured right

Card 1/2

The Measuring of the Electric Current in the Sea.

PA - 3043

down to the bottom of the sea. Measurements were carried out by means of the electrodes recommended by L.A. KORNEVA. Measuring is described. The numerical results of measurements are given. With increasing depth the potential gradient and current density increased too. The irregularity of the tidal currents exercised no influence on the general direction of the electric current in the oceanic regions investigated. In the earth-magnetic focus ( $64^{\circ} 15' 5''$  south latitude and  $92^{\circ} 44' 0''$  east longitude) the potential gradient on the 100 m horizon was  $9,0$  mV/km, current density  $2,41 \cdot 10^9$  Ampere/cm<sup>2</sup>, and the direction of the current was  $267^{\circ}$ . Further numerical data, also for the magnetic equator, are given.

**SCOPE:** This volume is intended for the general reader.

**COVERAGE:** The Report of the Combined Antarctic Expedition of the  
AN SSSR, headed by N. M. Somov, contains an account of the work on  
the first trip of the Diesel-electric ship "Ob" to the Antarctic  
and the aims and problems involved, including the establishment of  
an observatory at Mirnyy. A major part of the book is devoted to  
scientific research in serology, meteorology and actinometry,

conducted in cooperation with the IMV program. A large part of  
the observations and preliminary findings cited are in the field  
of hydrology and hydrochemistry, marine geology, geophysics,  
hydrography, and hydrobiology. A roster of the members of the  
expedition together with their specialities is included. There  
are 72 figures, including maps. Bibliographic references  
accompany separate chapters.

ABSTRACT: Vertical variations in oceanic circulation are undoubtedly due to the abrupt change in slope along the edge of the continental shelf. A most important problem is the development of large-scale vortical currents with horizontal axes over sharp breaks in floor profile, such as the edge of the shelf. Data for the present study came from the 15th voyage of the ship Mikhail Lomonosov. Detailed soundings were made along 2.5--5 mile profiles by an automatic bathythermograph. Two traverses made across the shelf of South America and one off the coast of Africa are illustrated in the paper. Vortical currents with horizontal axes (parallel the coast)

Card 1/2

ACC NR: AT6035089

were observed. The currents occur in pairs: downward currents are found near the break in slope, at the edge of the shelf; rising currents are found both shoreward and seaward. The development of one, two, or more vortical currents depends on the dimensionless criterion  $P = \frac{Vz}{\nu}$  where  $V$  is the wind velocity (in cm/sec)  $z$  is the ocean depth above the break in floor profile, and  $\nu$  is the coefficient of kinematic turbulent viscosity (in  $\text{cm}^2/\text{sec}$ ). This is formally similar to Reynolds number but differs in physical meaning, since it investigates the flow lines in a known turbulent regime rather than the transition from laminar flow to turbulent. In making his analysis of the data obtained from sounding, the author plotted flow directions for the various conditions of wind and depth. It was found that similar zones of convergence and divergence appear for any given value of  $P$ . Orig. art. has: 3 figures, 1 table, and 3 formulas.

✓ Root nutrition and resistance of cabbage sprouts to vascular bacterioids. A. S. Ryzhkova (All-Union Agr. Microbiol. Inst., Moscow). *Fiziol. Rastenii* 3, No. 5, 399-404 (1956).  
The form of N in the nutrient soln. greatly affects the resistance to infection. The most resistant plants were

those grown on ammonium N, the less resistant ones were grown on nitrates, while the least resistant received ammonium and nitrate N simultaneously. Plants grown with high N and K nutrition were particularly resistant, while high N tended to lower resistance greatly. The bactericidal action of plant juice is highest on low-N diet. No correlation between the content of sugars, and peroxidase and the nutrient compn. was found, with respect to disease resistance. G. M. Kosolapoff

TITLE: Hydropurification of sulphurous petroleum products on an  
industrial installation. (Gidroochistka sernistykh nefte-  
produktov na promyshlennoy ustanovke).

PERIODICAL: "Khimiya i Tekhnologiya Topliva i Masel" (Chemistry and  
Technology of Fuels and Lubricants) 1957, No.6, pp.36-41  
(USSR).

ABSTRACT: It is expected that hydropurification of sulphurous pet-  
roleum products will be widely used in the U.S.S.R. in the  
near future. On the basis of data on the process obtained  
by VNII NP and LEN NII, an industrial plant was designed  
and built by Giproneftezavod on one of the refineries. The  
plant is described (fig.1). The process is carried out  
using alumo-cobalt-molybdenum catalyst (developed by VNII  
NP) and hydrogen (99%), obtained by catalytic conversion  
of hydrocarbon gases. Straight run distillates and second-  
ary products are being treated to produce Diesel fuel  
(GOST 4749-49). Plant operating conditions are given in  
table 1 and the results of purification of straight run  
distillate from a mixture of Mukhanovskoy, Tuymazinskoy-  
Devonskoy and Bavlinskoy crude oils, light gas oil from

Card 1/3

Hydropurification of sulphurous petroleum products on an industrial installation. (Cont.)

65-6-6/13

catalytic cracking (from 200-500° fraction) and a 1:1 mixture of the above two distillates in table 2. The degree of desulphurisation 95.2-95.8%. The analysis of gases obtained during hydropurification is given in table 3. The circulating gas before the absorber (with monoethanolamine) contained 0.7-0.9 volume % of hydrogen sulphide, after the absorber - 0.1%. The mean balance of the products of hydropurification is given in table 4. Hydrogen consumption for straight run distillate was 0.38 wt % and for gas oil from catalytic cracking - 0.71 wt %. Hydrogen used for the reaction was 0.27% and 0.60% respectively. The sulphur balance is given in table 5. Up to 0.03% of H<sub>2</sub>S calculated on the raw material used is carried out with treated fuel and is removed by washing with 2.5 - 4% NaOH solution. The alkali consumption 0.1 kg per ton of Diesel fuel. The working period of the catalyst without regeneration is 8000 hrs. The regeneration of the catalyst is carried out at a temperature not exceeding 550° under 40 atm. pressure with a mixture of an inert gas with air. Initial oxygen concentration 0.2 - 0.25 vol % and at the end of the regenerating period is increased to 1.4%. When the main

Card 2/3

Hydropurification of sulphurous petroleum products on an industrial installation. (Cont.)

65-6-6/13

part of the "coke" was burned out, the remaining part was removed by increasing oxygen concentration to 2% and pre-heating the gas to 520-550 C (2 hours). Total duration of the regeneration process 20 hours. The initial activity of the catalyst is completely restored. When the plant was stopped for inspection it was found that the upper layer of the catalyst was covered with iron sulphide. Accumulations of iron sulphide were found in various places, i.e., the corrosion of the apparatus was noticeable. The parts of the apparatus containing H<sub>2</sub>S and H<sub>2</sub> at high temperatures were made from steel X5M, the remaining part from mild steel. Apparently the corrosion resistance of X5M steel was insufficient. The precipitation of iron sulphide on the catalyst has no apparent influence on its activity. There are 5 tables and 1 figure.

TITLE: Effect of cerium on the mechanical properties of 15KhIMF steel.

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 8, 1963, 23-27

TOPIC TAGS: 15KhIMF steel, cerium, calcium-silicon, ferrosilicon, ferrocerium, Ce

ABSTRACT: Authors studied under laboratory and production-line conditions the possibility of improving the plastic properties and impact toughness of a steel by modifying it with cerium. The properties of the test steel were analyzed on specially cast test samples, plates and commercial objects cast into forms of a quick-drying substance on liquid glass. Authors found that cerium increases the mechanical properties of 15KhIMF steel. The optimum quantity of cerium introduced into the steel is 0.1 to 0.15% (by calculation). The best results are obtained when the cerium is placed into the ladle or molten metal bath prior to tapping. For best elimination of non-metallic inclusions, the ferrocerium has to be put in together with calcium-silicon or ferrosilicon. The best effect from the cerium is obtained when it is put into the metal at 1500-1590C and the metal held for not more than 25 minutes after the cerium's introduction. Orig. art.

TITLE: Sorption of indium on anion exchange resin EDE-10P from hydrochloric acid solutions

SOURCE: Leningrad. Universitat. Metody kolichestvennogo opredeleniya elementov (Methods for the quantitative determination of elements). Leningrad, Izd-vo Leningr. univ., 1964, 92-95

TOPIC TAGS: indium separation, column chromatography, anion exchange resin, semiconductor analysis

ABSTRACT: The sorption of indium on the Cl form of anion exchange resin EDE-10P was studied experimentally to develop analytic methods for semiconductors containing In, Sn, Cd and Sb. The dependence of the distribution coefficient on hydrochloric acid concentration, the adsorption capacity of the resin for In from 2 N HCl solutions corresponding to analytic conditions, and the desorption of the metal by water and 0.5-10 N HCl (see Fig. 1 of the Enclosure) was studied. The maximum adsorption was achieved with 5-6 N HCl solutions, and 1 N or lower concentrated HCl solutions were shown to be usable for desorption of In. Orig. art.

TITLE:

The Mechanism of the Sensitizing Action of Triethanolamine on Photographic Emulsions (O mekhanizme sensibiliziruyushchego deystviya trietanolamina na fotograficheskiye emul'sii)

PERIODICAL:

Zhurnal nauchnoy i prikladnoy fotografii i kinematografii, 1958, Vol 3, Nr 4, pp 281-282 (USSR)

ABSTRACT:

The author carried out experiments to determine the nature of the sensitizing effect of triethanolamine on photographic emulsions. He found that it was effective only up to the time of exposure and is therefore not connected with the development process. Triethanolamine has only a very insignificant, if any, function as an acceptor of haloid atoms during exposure. The experiments contradicted the assumption of the silver nature of the centers of sensitivity but bears out Mitchell and Mott's hypothesis as to their nature. The triethanolamine's alkalinity is essential to its action. In a reaction of  $AgHal$  with it or with an alkali,  $AgOH$  is formed but the further reaction  $- AgOH \rightarrow Ag_2O \rightarrow Ag$  takes place without their participation. The author finally concludes that the end result of the action of triethanolamine on the emulsion crystals is the formation of subcenters of development sited

TITLE: The Action of Triethanolamine on Photographic Emulsions  
(Deystviye trietanolamina na fotograficheskiye emul'sii)

PERIODICAL: Doklady Akademii Nauk SSSR, 1958, Vol. 118, Nr 4,  
pp. 744-746 (USSR)

ABSTRACT: The authors investigated the influence of triethanolamine on the photosensitivity of an emulsion on various illumination conditions and used the so obtained results for the explanation of the mechanism of the sensitizing effect of triethanolamine in analogy with the other types of sensitisation. Besides, the action of ionizing particles upon the same emulsions was investigated. The authors examined the behaviour of 7 different emulsions. The exposure was made by an impulse-like source (duration of the flash  $1,2 \cdot 10^{-6}$  sec) and by a low-voltage bulb (duration of exposure 5 to 45 seconds) through a neutral-grey stepped absorption wedge with the constant 0,17. The exposure with  $\alpha$ - and  $\beta$ -rays was made by  $Po^{210}$  and by a

Card 1/3

## The Action of Triethanolamine on Photographic Emulsions 20-118-4-33/61

$\beta$ -radioactive sensitometer. Besides, an exposure with recoil-protons of a Ra-Be - neutron source was made. The development was performed under the usual conditions and the densities were measured by the photoelectric microphotometer M $\mu$  - 2. A diagram illustrates the dependence of the sensitivity on the concentration of the triethanolamine for all the investigated emulsions. All emulsions become more sensitive the lower the photosensitivity of the original emulsion is; in the case of a few emulsions with low sensitivity this increase amounts to 1,5 orders of magnitude. The action of the triethanolamine always is somewhat stronger for the initial domain (i.e. for the bigger emulsion crystals). The optimum concentration for the sensitivity increase is 1-2 %. A further increase of the concentration does not increase the sensitivity, but the blurring. A bathing in triethanolamine does not give any increase of the sensitivity and therefore the action of triethanolamine is not connected with the process of development. The dependence of the sensitivity of one of these nuclear emulsions on the concentration of triethanolamine for the various sorts of radiation is illustrated in

The Action of Triethanolamine on Photographic Emulsions 20-118 -4-33/61

a diagram. The increase of the sensitivity is in case of long-lasting exposure always greater than in case of a short light impulse. The action of triethanolamine is restricted to the formation of highly effective centers for the fixing of the conduction electrons which form in the emulsion crystals under the action of radiation. 4 more rules governing this action are given. There are 2 figures, and 5 references, 4 of which are Soviet.

TITLE: The Conservability of a Latent Image and of Sensitivity in Nuclear Photoemulsions Sensitized by Triethanolamine (Sokhranyayemost' skrytogo izobrazheniya i chuvstvitel'nosti v yadernykh fotoemul'siyakh, sensibilizirovannykh trietanolaminom)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 123, Nr 5, pp 874-877 (USSR)

ABSTRACT: The treatment of nuclear photoemulsions with triethanolamine increases their sensitivity for any kind of particles (also for relativistic particles). Subcenters are formed in the reactions of triethylamine with AgHal in the emulsion crystals on the sensitivity centers. The conversion of these subcenters into centers of development proceeds with a markedly higher efficiency than the formation of such centers in the absence of subcenters. The present paper gives the corresponding experimental results together with the results of experiments which were carried out in order to explain

Card 1/4

SOV/20-123-5-29/50

The Conservability of a Latent Image and of Sensitivity in Nuclear Photo-emulsions Sensitized by Triethanolamine

some details of the mechanism of the sensitizing of triethylamine. The experiments were carried out at temperatures of  $5^{\circ}$ - $6^{\circ}$  on various specimens of the emulsion NIKFI type R which were irradiated by relativistic electrons. The first table gives data concerning the regression and the degree of conservation of 2 specimens of emulsions. An increase of triethanolamine in concentration does not cause an essential increase in density of the track. The track increases slightly ( $\sim 10\%$ ) in density. The data of the first table make it possible to draw the following conclusion: The sensitivity and the latent image of emulsions sensitized by triethanolamine are totally conserved within the investigated time intervals and within the corresponding experimental errors. This property of triethanolamine is as essential as its sensitizing effect. The second table gives data which confirm the conclusion (Ref 4) that the sensitizing effect of triethanolamine is not due to its presence in the emulsion

Card 2/4

SOV/20--123--5--29/50

The Conservability of a Latent Image and of Sensitivity in Nuclear Photoemulsions Sensitized by Triethanolamine

during the irradiation (and especially not due to the absorption of the halogen separated out by the radiolysis of AgHal). Beginning with the formation of subcenters, the presence of triethanolamine in the emulsion is not of essential importance and the subsequent variation of the properties of the emulsion is determined by the presence of subcenters in the crystals. The decrease of triethanolamine in alkalinity (by adding acids which do not react with AgHal) diminishes its sensitizing effect. The experiments discussed in the present paper prove the sensitizing and also the stabilizing effect of triethanolamine in complete agreement with the mechanism of its interaction with the crystals of the photoemulsion. There are 3 tables and 7 references, 5 of which are Soviet.

"Electrons Formed During Decay of Fast Mesons," S. A. Azimov, V. F. Vishnevskiy, K. P. Ryzhkova, Phys-Tech Inst, Acad Sci Uzbek SSR

"Dok Ak Nauk SSSR" Vol 83, No 1, pp 55-58

Comparison of the theoretical value of the ratio of the number of decay electrons to the number of mesons (0.2 or 0.14) with the exptl value (8 $\pm$  4%) points to the very good agreement of the exptl data with the assumption that the fast mesons transmit to decay electrons 1/3 of their energy and not 1/2 as thought earlier. Conclude that mesons do not decay into 2 but rather into 3 particles. Submitted 2 Jan 52 by Acad D. V. Skobal'tsyn. Acknowledge the helpful instructions of professors N. A. Dobrotin and V. I. 5765. On the absorption and interaction of particles producing showers of nucleons and electrons. S. A. AZIMOV, N. A. DOBROTIN, A. L. LYUBIMOV AND K. P. RYZHIKOVA. *Izv. Akad. Nauk SSSR (Ser. Fiz.)* 17, No. 1, 86-7 (1953) in Russian.

The interaction and absorption free paths for the shower-producing particles have been measured for carbon, iron and lead using a hodoscoped counter set. The values found for the absorption mean free paths were  $216 \pm 15$ ,  $344 \pm 25$  and  $482 \pm 31$  g cm<sup>-2</sup> respectively. These results are discussed and it is concluded that they can only be explained by assuming that some plural production of mesons takes place. (Shortened version of Wataghin's summary (see Abstr. 5747 above) which contains 1 diagram.)

Absorption of cosmic-ray particles which generate electron-nuclear showers. (S. A. Arimov, A. I. Lyubimov, and K. P. Ryzhkova. *Doklady Akad. Nauk S.S.S.R.* 60, 51-4 (1953); cf. *C.A.* 45, 2791).—Cosmic rays were studied by means of an app. consisting of a row of counters (I); a sheet of absorber P, a 50-cm.-thick layer of Pb (to eliminate the transition d. effect), and a 2nd block of Pb contg. an assemblage of counters of which every other one was connected in parallel to form group II, while the remainder were connected in parallel to form group III. Neighboring counters of groups II and III were sepd. by 4 cm. Pb or more. The counters were arranged to register only when all 3 groups were excited simultaneously. Only electron-nuclear showers generated in the absorber by particles having energies of 10,000 m.e.v. or more were registered. The no. of showers observed per hr., the no. of counters of groups II and III excited, the av. absorption value  $\lambda_0$ , and  $\lambda_0/\lambda_0$  are tabulated for the absorbers C (graphite) (153 g./sq. cm.), Fe (252 g./sq. cm.), Pb (365 g./sq. cm.), and Pb (160 g./sq. cm.),  $\lambda_0$  being the av. free value corresponding to the geometrical nuclear cross section. It was concluded that the transitional d. effect was absent. Disintegrating particles were present among the exciting rays. Absorption in Pb was less than in an equal mass of C. Amts. of C, Fe, and Pb contg. equiv. nos. of shower-generating particles ( $\lambda_0$ ) showed the same degree of absorption. The value of  $\lambda_0/\lambda_0$  was about 8 for C, Fe, and Pb. J. Measurements of the coefficient of absorption of nuclear active particles of high energy

Periodical : Zhur. eksp. i teor. fiz. 28, 618-619, May 1955

Abstract : The authors state that the problem of the mechanism governing the collision of nuclear active particles of high energy ( $10^{11}$  to  $10^{12}$  eV) is presently of considerable interest; the data on the elementary act of collision of high-energy particles being obtained on the basis of a study of the dependence of the coefficient of absorption of such particles upon their energy (G. T. Zatsepin, *ibid.* 19. 1949). They performed corresponding measurements in the autumn of 1952 at two altitudes (3860 meters (Pamirs) and at sea level (Moscow)) with similar hodoscopic arrangement. They describe their attempts to obtain sufficient statistic data for the recording of nuclear active high-energy particles by the use of a detector of great thickness, which they describe. The authors thank G. T.

Abstract : The effect of methylcholanthrene crystals on the tissues of axolotls, was investigated. Results showed that the threshold of the blastomogenic effect of methylcholanthrene in the case of mammals is much lower than in the case of caudate amphibia. The destructive effect of methylcholanthrene induced growths is much greater for mammals than for caudate amphibians. Twelve references: 11-USSR and 1-USA (1924-1950). Illustrations.

The initial potential of discharges of insulators in transformer oils at low temperatures. N. F. Brykhova. *Elektricheskoe* 1941, No. 5, 60; *Chem. Zentr.* 1943, 1, 190.—The initial discharge potentials on the surface of glass in transformer oil were studied by a photographic method. As the temp. was reduced below 0° the initial discharge potentials increased at first slowly, then below about -20° more rapidly, until below about -45°, when they increased more slowly again and appeared to approach a const. value of about 10.5 kv. TITLE: Absorption of radiation due to the Sag-A source  
by neutral interstellar hydrogen

PERIODICAL: Astronomicheskii zhurnal, v.40, no.1, 1963, 17-22

TEXT: The large Pulkovo radiotelescope was used in 1961 to record the continuous spectrum of Sag-A at 21 cm. The beamwidth at half-power points of this telescope was  $0.14^\circ$  and  $5^\circ$  in the horizontal and vertical planes, respectively. The bandwidth of the receiver was 1.5 Mc/s. The average transit curves for Sag-A exhibit the structural details noted by Drake (Nat. Rad. Astron. Obs. USA, Ann.report; 2, 1959). A receiver with a bandwidth of 80 kc/s was used to investigate the absorption of Sag-A emission by neutral hydrogen in the neighbourhood of the sun and in the expanding spiral arm at 3 kpc from the centre of the Galaxy ( $v = -53$  km/s). All the components of the source undergo roughly the same absorption by hydrogen in the vicinity of the sun. The radiation from the south-western part of Drake's ring

Calculation of equilibrium gas flow in supersonic nozzles (Raschet  
ravnonesnykh techeniy gaza v sverkhzvukovykh soplakh) Moscow,  
VTs AN SSSR, 1964. 59 p. illus., biblio. 1850 copies printed.

Series note: Akademiya nauk SSSR. Vychislitel'nyy tsentr. Trudy

TOPIC TAGS: equilibrium gas flow, supersonic nozzle, annular  
nozzle, nozzle design 26

PURPOSE: This book is intended for technical personnel concerned with  
design and operation of nozzles.

COVERAGE: The procedure and formulas for calculating of gas flow  
parameters in plane and axisymmetric nozzles are presented. Steady  
equilibrium flows of an imperfect gas with arbitrary thermodynamic  
characteristics are examined. Equations are given for a particu-  
lar case of an adiabatic flow of a perfect gas. Gas flows in noz-  
zles with plane nozzles and with a break in the generatrix at the

L 50193-65

3

discharge section, as well as in annular nozzles are examined. The method of characteristics properly adapted for the computation on electronic computers is utilized. The author thanks Yu. D. Shmyglavskiy, A. N. Krayko, and O. S. Ryzhov, for their advice and comments. There are 41 references: 27 Soviet, 12 English, and 2 German.

TABLE OF CONTENTS:

Introduction -- 3

Equations. Basic problems -- 4

Chapter 1: Flow in the vicinity of the throat -- 8

1. A nozzle with a central entrance -- 8

2. Annular nozzles with one corner point -- 15

3. Annular nozzles with two corner points -- 16

Chapter 2: Flow analysis in the accelerating portion of the nozzle -- 22

Card 2/4

L 50193-65

AM5013082

1. The method of characteristics for equilibrium flow of an imperfect gas -- 22
2. Peculiarities determining the corner point and points on the axis -- 26
3. Establishing adiabatic-flow conditions -- 27
4. Procedure for calculating the accelerating portion of a nozzle. Peculiarities of the procedure -- 31

Chapter 3: Flow analysis in the smoothing portion of the nozzle -- 34

1. A nozzle with a given generatrix -- 34
2. Determining the generatrix of a nozzle according to given conditions in the discharge section -- 35

Chapter 4: Numerical examples of computations -- 37

1. Examples of determining certain points by the method of characteristics -- 37
2. An example of nozzle design -- 40

Appendix -- 43

Title : On the Microflora of the Soil of the  
Western Coast of Novaya Zemlya.  
Orig Pub : Dokl. AN SSR, 1957, 106, No 5, 914-916  
Abstract : From 39 specimens, gathered on the Western  
Seacoast of Novaya Zemlya in the zone  
of the Arctic tundra and the zone of the  
Arctic desert, 247 strains of bacteria  
and 20 strains of actinomyces (on "MPA"  
and mineral media of Chapek and Eshba)  
were isolated. The total number of  
microorganisms was calculated at tens  
of thousands of cells. Fungi were found  
very seldom. No azotobacteria were

Card 1/2

F-3

Abs Jour : Ref Zhur-Biologiya, No 1, 1957, 561

Abstract : found at all. The qualitative composition of bacteria was homogenous, with nonsporous forms and microbacteria in particular, predominating. *Bacillus mycoides*, *Bacillus serus*, *Bacillus mesentericus*, and *Bacillus nugatherium* were not found. It is possible that in the Arctic conditions of Novaya Zemlya many bacteria exist in a vegetative state and frequently lose their ability to form spores.
